

Project Design Phase
Problem – Solution Fit Template

Date	01 October 2026
Team ID	SWTID-2026-8331
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	2 Marks

Problem – Solution Fit Template:

Problem–Solution Fit checks whether the Script-Controlled ACL solution addresses the actual record-access problem faced by its users. It connects the field-value access problem, user behaviour, existing alternatives and the proposed ACL solution so the team can verify that the solution directly fits the need.

Purpose:

- ☐ Solve the field-based record-access problem in a way that fits the needs of administrators, developers and authorized users.
- ☐ Increase adoption by fitting field-aware access control into existing application and API access workflows.
- ☐ Make the access-control rule, Allow/Deny outcome and security reason clear to the people configuring and using the system.
- ☐ Build trust by reducing repeated permission failures, unauthorized exposure risks and manual access checks.
- ☐ Understand current ACL behaviour and constraints so the project can improve record access control for the target users.

Template:

Before CS, define CS, fit into Focus on J&P, map into BE Identify strong TR & EM	1. CUSTOMER SEGMENT(S) CS Who is your customer? System administrators, security teams, application users and developers who need record access controlled by field values.	6. CUSTOMER CONSTRAINTS CC What prevents customers from taking action? Static ACLs can be too broad, field-aware rules may require scripting, and teams need secure, auditable decisions without excessive configuration.	5. AVAILABLE SOLUTIONS AS Which solutions are available today? Role-based ACLs, manual permission checks, scripted conditions and custom middleware. These approaches may not provide single field-value-driven record control.	Explore AS, differentiate Focus on J&P, map into BE, understand RC Extract online & offline CH
	2. JOBS-TO-BE-DONE / PROBLEMS J&P Which jobs-to-be-done or problems do customers need solved? Restrict record access according to a field value, prevent unauthorized read or update actions, and apply consistent access decisions.	9. PROBLEM ROOT CAUSE RC What is the real reason this problem exists? Access rules often evaluate roles or permissions without directly evaluating the protected record's field value, making fine-grained control difficult.	7. BEHAVIOUR BE What does the customer do to address the problem? Users request records through the application or API; administrators configure ACL rules; developers inspect access results and logs when requests are blocked.	
	3. TRIGGERS TR What triggers customers to act? Sensitive records, changes to field values, compliance requirements, new access requests, or an incident that reveals overly broad permissions.	10. YOUR SOLUTION SL Script-Controlled ACL evaluates the relevant record field against a configured condition and returns an Allow or Deny decision. The rule can be tested, audited and applied consistently to protected records.	8. CHANNELS OF BEHAVIOUR CH 8.1 ONLINE — Web application, API requests, admin console and automated record operations are the main access channels. . 8.2 OFFLINE Offline — Administrative reviews, security meetings, policy documentation and manual testing can be used to review and validate access rules.	
	4. EMOTIONS: BEFORE / AFTER EM Before: concern about unauthorized access, confusing permission failures and manual checks. After: confidence that access follows the configured field-based rule and decisions are explainable.
