

Project Design Phase

Problem – Solution Fit Validation

Date	01 October 2026
Team ID	SWTID-2026-8331
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	2 Marks

Problem–Solution Fit Validation

Validation Point	Project Finding
Problem	Broad role-based access may be too broad for record-specific conditions.
Customer	Security administrator / data owner needs precise and repeatable record-level access control.
Existing Behaviour	Administrators configure roles and ACLs, then test access to protected records.
Gap	Role permission alone may not express every record-specific condition.
Solution Fit	A field-value-aware ACL evaluates the target record during authorization.
Expected Benefit	Precise authorization, predictable Allow/Deny decisions and testable rules.
Adoption Consideration	Keep conditions simple, documented and tested with positive and negative cases.

Validation Evidence

The supplied implementation evidence shows the ACL configuration, the Branch = EEE data condition with the Advanced script, and the resulting Institution Details record. These demonstrate the configured solution path. A separate denied-access screenshot was not supplied.
